

DELIVERY LABELS EXTENDED

from Vinum Master

How to update the printing settings directly in the code ?

If the labels are not correctly printed after a visual configuration, it will be necessary to change the settings directly in the code.

To do that, edit the file `modules/deliverylabelsextended/createlabel.php`.

Normally at the ligne 44.

You should have :

```
$pdf = new PDF_Label(array('paper-size'=>'A4', 'metric'=>'mm', 'marginLeft'=>1,
'marginTop'=>1, 'NX'=>$colonne, 'NY'=>$ligne, 'SpaceX'=>0, 'SpaceY'=>0, 'width'=>$width,
'height'=>$height, 'font-size'=>$size, 'font'=>$font));
```

You can to change the values of :

`marginLeft` (Left margin)

`marginTop` (Top margin)

`NX` (Horizontal labels number)

`NY` (Vertical labels number)

`SpaceX` (Horizontal space between 2 labels)

`SpaceY` (Vertical space between 2 labels)

`width` (Label width)

`height` (Label height)

`font-size` (Font size)

`font` (Font name : arial etc...)

By changing that values you should be able to make it work correctly.

There is some settings samples in the file: `PDF_label.php`.

Where some labels formats are configurated at the line 59 in the tab `$_Avery_Labels`
